

## Controls

## Power Up

Long press the power button to on/off the tags. A solid green LED will appear on powering up. A Solid red LED will appear just before shut-off. On start-up the tags will be in the last used alert mode either buzzer or vibration. Under normal operation, the LED will be blinking green.

## Set-up

Double press the power button to switch between alert modes. As you switch between modes, the light will:

- 1 green LED blink = silent mode (only vibration, no buzzer)
- 2 green LED blinks = medium volume mode (vibration + buzzer)
- 3 green LED blinks = high volume mode (vibration + buzzer)

The tag will remember its volume mode when you turn it off.

The tag comes pre-programmed for a 2m safe distance. The safe distance can be changed by logging on to Casella Infection Insights App. If you have not purchased the complete Orbi-Trace kit then please consult Casella or an authorised Distributor to change the safe distance.

### Charging

The tag has a 2000mAh battery, rechargeable via a USB-C charging cable. The flat-to-full charge cycle takes 5 hours. Upon plugging in the charging cable, the LED will turn into solid amber and remain in that state until full charge when it turns into solid Green.

### Belt Clip

The belt-clip on the back can be detached. The clip is also available to order separately as an accessory.

### Further Information

Visit the 'Support' section [www.casellasolutions.com](http://www.casellasolutions.com) for further information on use of the Orbi-Trace Tag and associated products.
